                                                                                                                                                                                                                                                                                                                                                                                                                     -:- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), peta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c. similarity: Belongs to the ATPase epsilon chain family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -!- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(1), beta(3), pamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c. -! SIMILARITY: Belongs to the ATPase delta chain family.
                                                                                                                                                                                                                                                                                                              Gaps

"So million years of genomic stasis in endosymbiotic bacteria.";
Schence 296:2376-2379(2002).
-I-FUNCTION: This protein seems to be part of the stalk that links
CF(0) to CF(1). It either transmits conformational changes from
CF(0) inco CF(1) or is implicated in proton conduction.
-I- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Sequence analysis of a 34.7-kb DNA segment from the genome of the profile of a sphidicola (endosymbiont of aphids) containing groEL, dnaA,

Also secreted. TISSUE SPECIFICITY: Expressed in ciliary body, iris, retina, trabecular network and sclera but not in lens or cornea. Also expressed strongly in skeletal muscle and weakly in heart, brain, testis, liver, kidney, thyroid and epididymis. No expression detected in embryo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                           a low intraocular pressure. Variant Thr-164 is found in strains C3H/HeJ and C57BL/6J, two strains which have a relatively high intraocular pressure.

-!- SIMILARITY: Belongs to the olfactomedin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BY SIMILARITY.

                                                     acid 4-hydroxylase.";
J. Biol. Chem. 271:29922-29927(1996).

-!-FUNCTION: Plays a key role in retinoic acid metabolism. Acts on retinoids, including all-trans-retinoic acid (RA) and its stereoisomer 9-cis.RA. Capable of 4-hydroxylation, hydroxylation. Responsible for generation of several hydroxylated forms of RA, including 4-OH.RA and 4-oxo-RA.

-!-SUBCELLUIAR LOCATION: Membrane-bound. Endoplasmic reticulum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

-!-FUNCTION: May participate in the obstruction of fluid outflow in the trabecular meshwork (By similarity).
-!-SUBUNIT: Homodimer. Interacts with MYOC (By similarity).
-!-SUBCELULAR LOCATION: Located preferentially in the ciliary rootlet and basal body of the connecting cilium of photoreceptor cells, and in the rough endoplasmic reticulum. Also secreted (By

J. Biol. (Gem. 268:2836-2843(1993).

-!- FUNCTION: NMDA RECEPTOR SUBTYPE OF GLUTAWATE-GATED ION CHANNELS POSSESSES HIGH CALCIUM PERMEABILITY AND VOLTAGE-DEPENDENT SERNSITYLYTY TO MAGNESIUM AND IS MODULATED BY GLYCINE.

-!- SUBUNIT: Heterodimer of an epsilon subunit and a zeta subunit.

-!- SUBUNITY: Belongs to the ligand-gated ionic channel family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Heteromeric NMDA receptors: molecular and functional distinction of

Engles, a protein required for cytokinesis in fission yeast, is a component of the actomyosin ring and the spindle pole body.";
Curr. Biol. 8:611-621(1998).
-!- FUNCTION's Required for cytokinesis. Component of the contractile F-actin ring; required for its construction following assembly of F-actin ring; required for its construction following assembly of F-actin ring. Interestes with calmodulin.
-!- SUBMUIT: Interestes with calmodulin.
-!- SUBCELLULAR LOCATION: Localized to the F-actin ring and spindle pole body during interphase and mitosis. Also found in
Daga R.R., Cruzado L., Jimenez J., Sanchez M., del Rey F., Benito J., Dominguez A., Revuelta J.L., Moreno S., Armstrong J., Forsburg S.L., Cerrutti L., Lowe T., McCombie W.R., Paulsen I., Potashkin J., Shpakovski G.V., Userey D., Barrell B.G., Nurse P.; "The genome sequence of Schizosaccharomyces pombe."; Nature 415:871-880(2002).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SMART; SM00033; CH; 1.

--- SUBCELIULAR LOCATION: Secreted.
--- TISSUE SPECIFICITY: Neutrophilic granules.
--- SIMILARITY: Belongs to the beta-defensin family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Brunet J.-F., Shapiro E., Foster S.A., Kandel E.R., Iino Y.; "Identification of a peptide specific for Aplysia sensory neurons by PCR-based differential screening."; Science 252:856-859(1991)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: May function as an inhibitory cotransmitter acting in conjunction with the fast excitatory transmitter released by sensory neurons. The peptide selectively inhibits certain postsynaptic cells probably by means of sensorin A release. SUBCELLULAR LOCATION: Throughout the neuronal cells (cell body, axon and presynaptic terminals). TISSUE SPECIFICITY: Seems to be specific to the mechanosensory neurons of the central nervous system.
"Peculiar feature of the organization of rRNA genes of the Chlorella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AMIDATION (G-55 PROVIDE AMIDE GROUP).

                                                                                                                                                                                                                                                   Mol. Gen. Genet. 263:881-585 (2000).
-1- FUNCTION: One of the primary rRNA binding proteins, it binds directly to 16S rRNA central domain where it helps coordinate assumily of the platform of the 30S subunit (By similarity).
-1- SUBUNIT: Part of the 30S ribosomal subunit.
-1- SUBCELLULAR LOCATION: Chloroplast.
-1- SIMILARITY: Belongs to the S8P family of ribosomal proteins.
                                                                                                                                                                                                              "Complete nucleotide sequence of the Oenothera elata plastid chromosome, representing plastome I of the five distinguishable Eucenothera plastomes.";
